Short description 43 words

WebRun is an AI business automation platform. Its AI agents automate marketing outreach, customer service, sales, finance, scheduling, hiring and operations inside the tools your team already uses. Show it a task once and it runs on a schedule, with every run recorded.

Full description 334 words

WebRun is an AI business automation platform. Its AI agents handle the repetitive work your team does every week, inside the tools you already use and on a schedule you set.

WebRun can automate:

- **Marketing outreach:** emails past customers when it's time to reorder and wins back the ones who stopped buying.
- **Customer service:** answers customer emails, routes support tickets to the right person and replies to Google reviews.
- **Sales:** replies to new leads within minutes and follows up on quotes that haven't been accepted.
- **Finance:** chases overdue invoices, reconciles vendor bills and sends you a weekly profit and loss summary.
- **Scheduling:** books appointments, sends reminders and follows up with no-shows.
- **Hiring:** screens and shortlists applicants, then sets up each new hire in every tool they need.
- **Operations:** drafts reorders when stock runs low and turns work-order emails into jobs.

There is nothing to integrate. WebRun uses your tools the way a person does: it looks at the screen, then clicks and types. It works with Gmail, Salesforce, QuickBooks and Xero, and just as well with the in-house admin tool nobody builds connectors for.

Setting up an agent takes minutes. Describe the task in plain language, record your screen once while you do it, or start from one of more than 14,000 ready-made templates. Your first automation can be live the same day, with no technical background.

Every agent gets its own computer: a browser that stays logged in between runs, file storage and a memory of your preferences. Tasks start in under a second, and an agent adjusts on its own when a website moves things around. 85% of tasks finish with no human involvement. For the rest, the agent pauses and messages you for a decision.

Automation Policies keep you in control. They check every click, keystroke and page, block risky actions and stop anyone from tricking an agent into doing something it shouldn't. Ready-made presets cover healthcare, finance, research-only and strict lockdown. Every run is recorded so you can replay it.
